1 Task 2

How do you pass a file name to a program using the -i and -o options?

That is done, by simply passing the name of the file to the script. The selection of what the right file is done with the options "-i and -o" in the script itself is defined, that a string that is written behind the -i is saved behind the "*infile pointer" and behind the -o is saved behind the "*outfile pointer". The addresses filenames are now saved on these pointers. Now you could use the filenames in the program for example if you want to open these files.

What are typical use cases for parameters versus flags? How do they differ from one another?

I think
